1 System Architecture Narrative

Monicur is securely hosted on AWS following their "Well Architected" principals. Application and database servers are in secured private subnets which are not directly connected or accessible via the public internet. Our single ingress point (the load balancer) is protected with Cloudflare's Web Application Firewall and DDoS protection.

AWS services such as Trusted Advisor, Security Hub, Audit Manager, AWS Config, and Control Tower are implemented to further harden our security posture.
